

Device Manager Report

Helpful Report if the Computer should Crash!

Your Windows Device Manager shows you what makes your computer tick. In Device Manager, you'll find the name, settings, and driver file details for every device and piece of hardware installed on your system. Look to the Device Manager for information about the computer's resources that the devices use to communicate with each other.

Having a printed report listing Device Manager data for all of your computer's hardware and an easy-to-read rundown of all of your system's used resources can be a handy reference when talking to a technical support professional, upgrading your system, or troubleshooting resource conflicts among devices. Below are the outlined steps for creating and printing Device Manager Reports.

You can access your Windows Device Manager by right clicking on My Computer and then clicking on the properties button. Click the Device Manager tab. In Windows XP you click Start first.

You should now see a tree directory organized into hardware classes or categories, the default view for the Device Manager. All of the devices on your system are listed in this directory, including the modem, keyboard, and computer ports. To generate a Device Manager report, just click the Print button at the bottom of the System Properties window to bring up the Print window.

Your given three print choices for your Device Manager report: choose a System Summary
